

Crossbow Colour Overlays for Visual Stress, Irlen Syndrome, Dyslexia, and Scotopic Sensitivity

Part codes: *(see below for options)*

Description

Visual Stress is also known as Meares-Irlen Syndrome. Visual Stress is often experienced by people with dyslexia, but is a separate and distinct condition. Apparent movement and distortion of text, headaches and sore eyes are common symptoms of visual stress.

Coloured overlays can significantly reduce the symptoms of visual stress by filtering out the wavelengths that over-stimulate the visual cortex. Crossbow coloured overlays are carefully formulated in line with scientific research and can be combined to produce a range of 30 tints covering the full chromaticity of the spectrum.

Sold in packs of 5 sheets, the overlays have a matt and a glossy side to give the user more choice.

Not sure which colour you need? You can also buy a mixed pack of either 5 or 10 colours to try. You can even double up 2 different colours to get an even finer tuned result.
