### What is Blue Light?

The high frequency light penetrates young retinas, giving their brain a cue that it's time to wake up and seize the day. Extended exposure to blue light can result in retinal cell death, headaches, dry eyes, and fatigue. These are all common symptoms of blue light exposure in children.

By restricting the production of melatonin (the chemical which helps us sleep) blue light disrupts the natural sleep cycles of kids, causing lethargy, irritability, and a drop in focus.
